Session 3 - Assignment Questions

Question 1: Greeting Function

Write a function **greet(name)** that takes a person's name and prints a greeting such as Hello, Rahul!.

> **Hint:** Use a parameter to receive the name.

Question 2: Add Two Numbers

Write a function **add(a, b)** that returns the sum of two numbers. Call it with two different pairs of numbers and print the results.

> **Hint:** Use return a + b.

Question 3: Even or Odd

Write a function **check_even(number)** that prints whether a given number is even or odd.

> **Hint:** Use the modulo operator %.

Question 4: Find the Maximum

Write a function **find_max(a, b)** that returns the greater of two numbers. Test it with two different inputs.

> **Hint:** Compare the values using if-else.

Question 5: Simple Interest

Write a function **simple_interest(principal, rate, time)** that calculates and returns simple interest. Call the function and display the result.

> **Hint:** Simple Interest = (Principal × Rate × Time) / 100.

Question 6: Student Details

Create a class **Student** with attributes name and roll_no. Create two student objects and print the details of both.

> **Hint:** Use __init__() to initialize attributes and self to store them.

Question 7: Rectangle Area

Create a class **Rectangle** with attributes length and width. Add a method area() that prints the area. Create an object and call the method.

> **Hint:** Area = length × width.

Question 8: Mobile Phone

Create a class **MobilePhone** with attributes brand and battery_percentage. Add a method charge() that sets the battery percentage to 100. Create an object and display its battery percentage before and after charging.

> **Hint:** Use an instance method to update self.battery_percentage.

Question 9: Book Information

Create a class **Book** with attributes title and author. Add a method display_info() to print both attributes. Create two book objects and display their information.

> **Hint:** Each object should store its own title and author.

Question 10: Product Price

Create a class **Product** with attributes name and price. Add a method display_price() that prints the product name and price. Create an object and call the method.

> **Hint:** Initialize attributes in the constructor and access them using self.
